

Nocode

No-code web development is a style that enables both programmers and non-programmers to create applications without writing any code by utilising a graphical user interface. A platform or tool called "no-code" is made to make it easier for non-technical users and developers to create web and mobile apps quickly. The pages of the web application are made using AI. Additionally, utilising Word and Text files, we may develop a website that functions like a blog application. Without having to write any technical code, anyone may construct AI apps thanks to the machine learning tools that artificial intelligence can provide. Using this No-code, you can build a website every day. It resembles a product with a service component. We can host the template on our server and implement the AI chatbot without writing any code. To solve any issues that may arise during the creation of a data base for a game or website, we designed the visual drag and drop methodology.

TechStack :

- **Backend**
 - **Python**
 - **JS**
 - **Ajex**
- **Frontend**
 - **Html**
 - **Css**
 - **Tailwind**
- **Database**
 - **MySql**
